==========

ECAL test beam geometry of 5x5 crystals. https://gitlab.cern.ch/dejardin/h4sim

Regarding extracting deposited energy (By Alpana on 14/02/25):

I am sharing some examples how the energy deposited in the absorbers can be extracted. These can not be directly plugged into your setup but can give you an idea on how to go about it.

1. From standalone HGCAL simulation - this may work for you as it is CMSSW independent.

Looping over all elements in your volume and add the energy deposited in each block if it is an absorber
https://github.com/pfs/PFCal/blob/2922434ce888d40acdc832d13313c1e6a8835278/PFCalEE/src/SamplingSection.cc#L207

A volume is called absorber if it satisfies these conditions. These conditions can be updated as per your geometry.
https://github.com/pfs/PFCal/blob/master/PFCalEE/include/SamplingSection.hh#L112-L124

2. This is how we were doing in HGCAL TB simulation setup
https://gitlab.cern.ch/kalpana/hgcal_reconstruction_framework/-/blob/Gen_simstep/SimG4CMS/HGCalTestBeam/plugins/HGCPassive.cc#L435

3. This code I added to extract energy leaked out of the detector,
https://gitlab.cern.ch/kalpana/hgcal_reconstruction_framework/-/blob/Gen_simstep/SimG4CMS/HGCalTestBeam/plugins/HGCPassive.cc#L199-371

but you can modify it to get energy in the absorber energy if you can get access
https://gitlab.cern.ch/kalpana/hgcal_reconstruction_framework/-/blob/Gen_simstep/SimG4CMS/HGCalTestBeam/plugins/HGCPassive.cc#L317
